Passing probability: direct Monte Carlo vs. $K\,c^{n_{dof}/2}$, K from the geometry
$P_{direct} / K\,c'^{\,n_{dof}/2}$
$c' = c/\lambda^2$ (the cut, mapped onto the reference detector)
4 planes (n_{dof} = 4): P from 4e-07 to 2e-02
6 planes (n_{dof} = 8): P from 3e-07 to 4e-03
At least 5 of 6 planes: noise-only events, every passing combination
hits per plane:
100
40
150
